

APPLICATION NO. 09/846,410

TITLE OF INVENTION: Multiple Data Rate Hybrid Walsh Codes for
CDMA

INVENTOR: Urbain Alfred von der Embse

5

CLAIMS

WHAT IS CLAIMED IS:

10

5. A method for the design and implementation of fast encoders and fast decoders for Hybrid Walsh and generalized Hybrid Walsh complex orthogonal CDMA channelization codes for multiple data rate users over a frequency band with properties

15

Hybrid Walsh inphase (real axis) codes and quadrature (imaginary axis) codes are defined by lexicographic reordering permutations of the Walsh code

20

Hybrid Walsh codes have a 1-to-1 sequency~frequency correspondence with the DFT codes and have a 1-to-1 even~cosine and odd~sine correspondences with the DFT codes

25

Hybrid Walsh codes take values $\{1+j, -1+j, -1-j, 1-j\}$ or equivalently take values $\{1, j, -1, -j\}$ with a (-45) rotation of axes and a renormalization

30

generalized Hybrid Walsh codes can be constructed for a wide range of code lengths by combining Hybrid Walsh with DFT (discrete Fourier transform), Hadamard and other orthogonal codes, and quasi-orthogonal PN codes using tensor product, direct product, and functional combining

algorithms are defined to map multiple data rate user data symbols onto the code input data symbol vector for fast encoding and the inverses of these algorithms are defined for recovery of
5 the data symbols with fast decoding

encoders perform complex multiply encoding of complex data to replace the current Walsh real multiply encoding of inphase and quadrature data

10

decoders perform complex conjugate transpose multiply decoding of complex data to replace the current Walsh real multiply decoding of inphase and quadrature data

15

6. A method for the design and implementation of encoders and decoders for complex orthogonal CDMA and generalized complex orthogonal CDMA channelization codes for multiple data rate users over a frequency band with properties

20

complex codes inphase (real axis) codes and quadrature (imaginary axis) codes are defined by reordering permutations of the real Walsh codes

25

generalized complex codes can be constructed for a wide range of code lengths by combining the complex codes with DFT (discrete Fourier transform), Hybrid Walsh, Hadamard and other orthogonal codes, and quasi-orthogonal PN codes using tensor product, direct product, and functional combining

30

fast encoding and fast decoding implementation algorithms are defined

algorithms are defined to map multiple data rate user data symbols onto the code input data symbol vector for fast encoding
35

and the inverses of these algorithms are defined for recovery of
the data symbols with fast decoding

encoders perform complex multiply encoding of complex data
5 to replace the current Walsh real multiply encoding of inphase
and quadrature data

decoders perform complex conjugate transpose multiply
decoding of complex data to replace the current Walsh real
10 multiply decoding of inphase and quadrature data
